# Object Detection and Pose Estimation in Robot Bin Picking

---

Group members: Hu Jiawei, Liu Xu, Lee Changyo,  
Yang Ruoyu, Zhao Nianyou, Zhou Dexin

2019.06.04

上海交通大學

SHANGHAI JIAO TONG UNIVERSITY

# Background

**Industrial automation**

**warehouse automation**

# Hardware System

**Move Base and Robot**

**Camera Realsense-300**

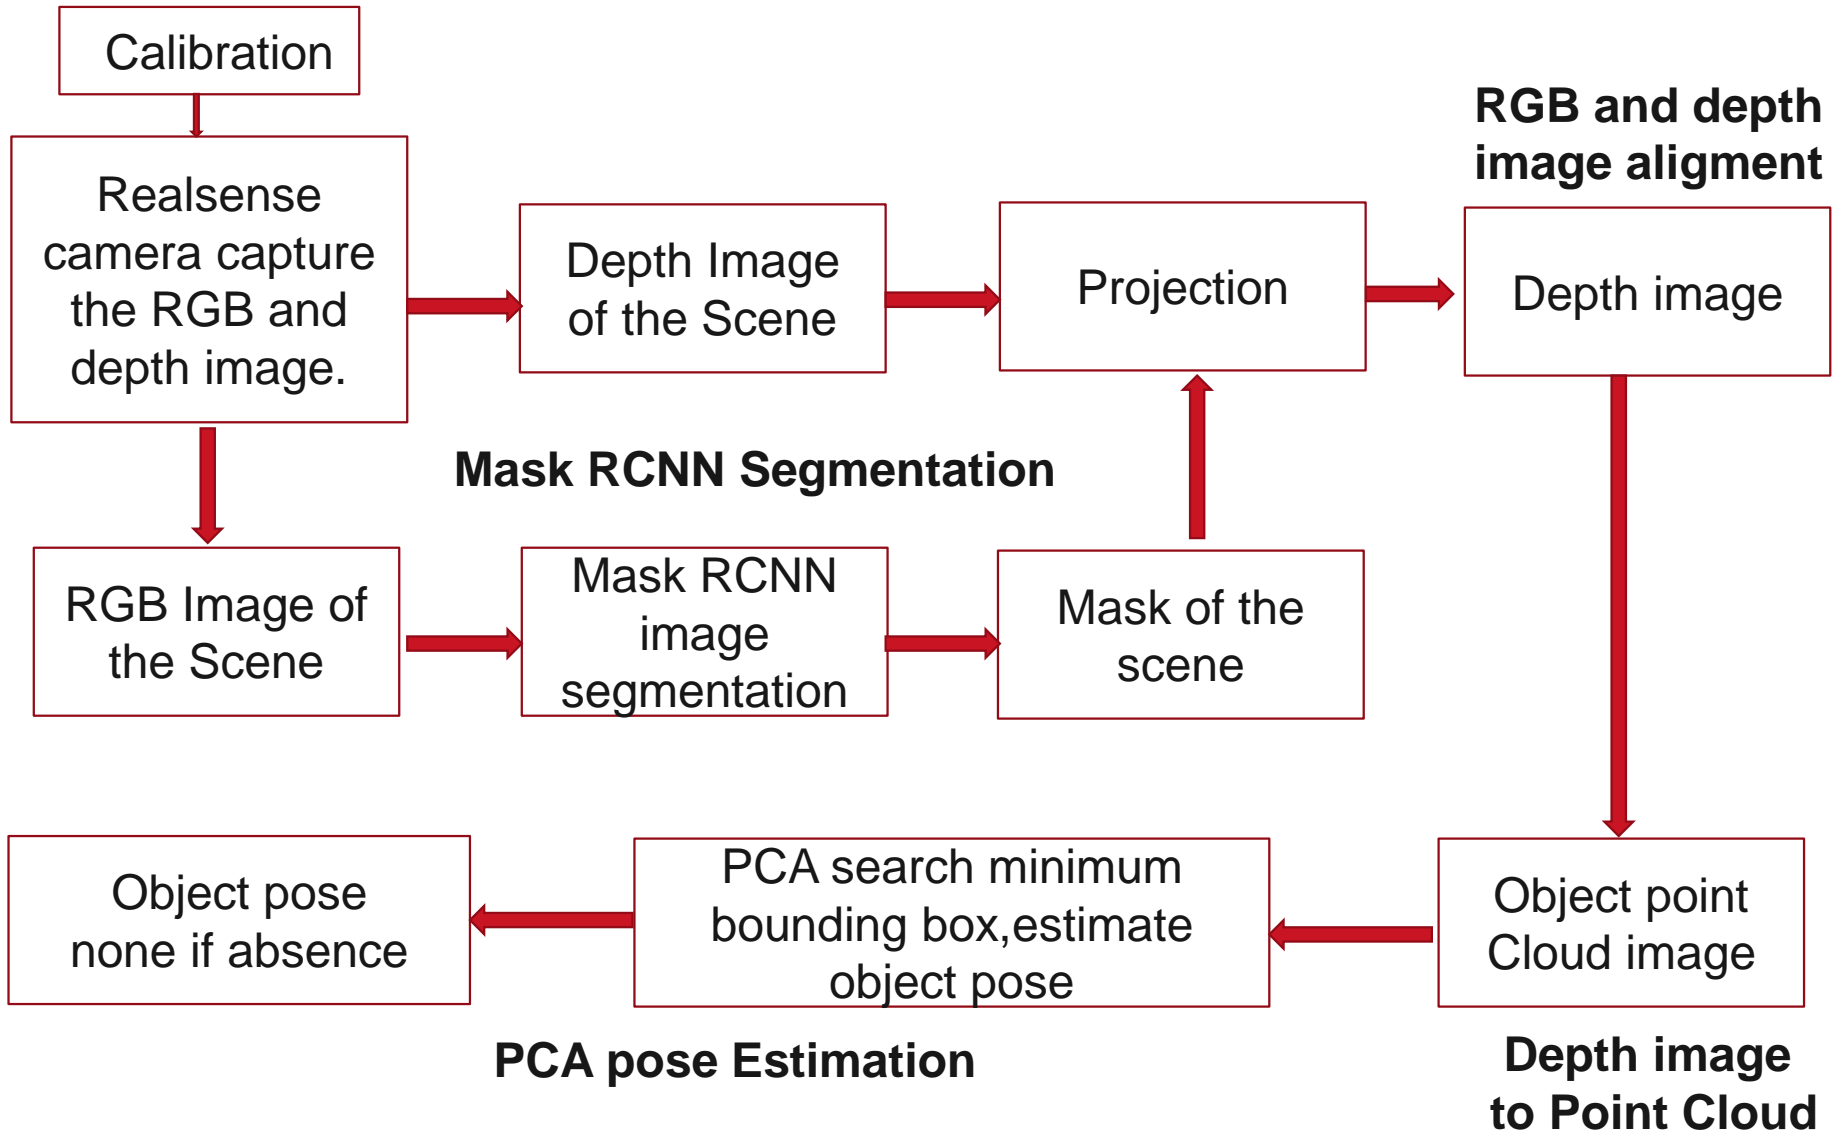

**Environment**

# Object Detection and Pose Estimation Process

# Camera calibration and hand-eye calibration

**Camera Calibration:**  
**Opencv、 Chessboard**

**Hand-eye Calibration:**  
**ROS Pacakge: easy-hand-eye**  
**Aruco Marker**

# Object Detection

## Mask R-CNN:

## Advantages of Mask R-CNN:

- 1) effective in detecting objects
- 2) generate the segmentation mask of every instance with high quality
- 3) has good generalization and is easy to be transformed to other tasks

# Training data Collection

## ➤ 18 categories

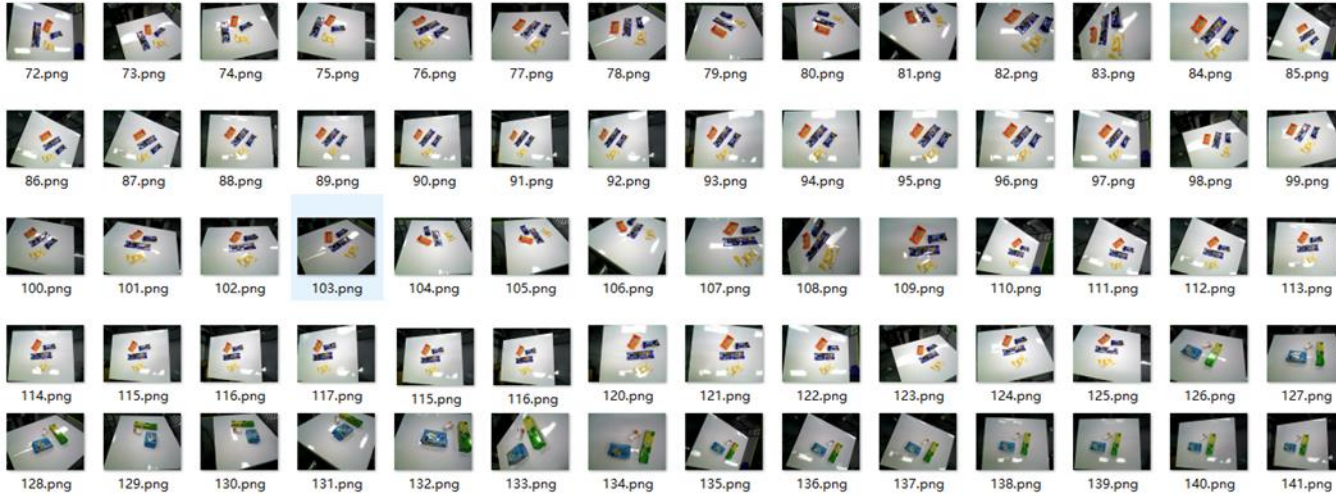

Calcium tablets  
Calcium tablets sticker  
Fries  
Sausage  
Shampoo  
Cap of shampoo  
Teething stick  
Oreo  
Chips  
Paper  
Biscuits  
Toothbrush  
Toothpaste  
Book  
Guozhen  
Coca cola  
Milk  
Orange

- **Collect 900 images**
- **Data Enhancement:**  
rotate image 、 increase exposure、 add noise
- **Final training data:**  
**18000 images**

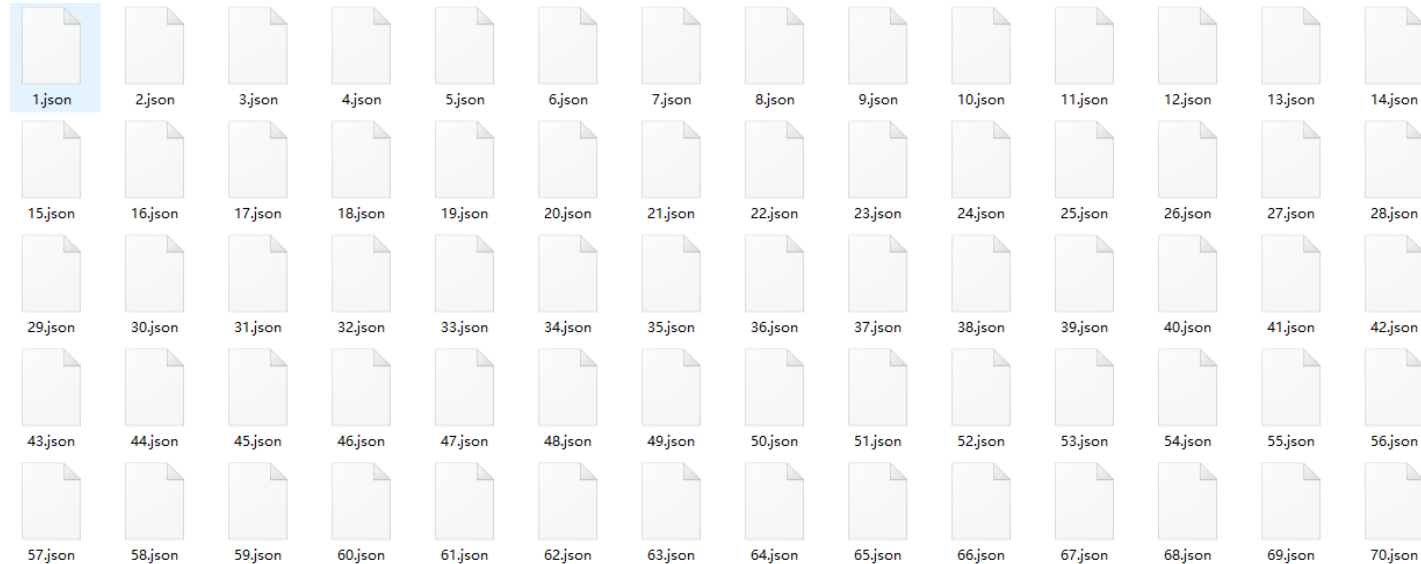

# Training data Collection

## Training Data

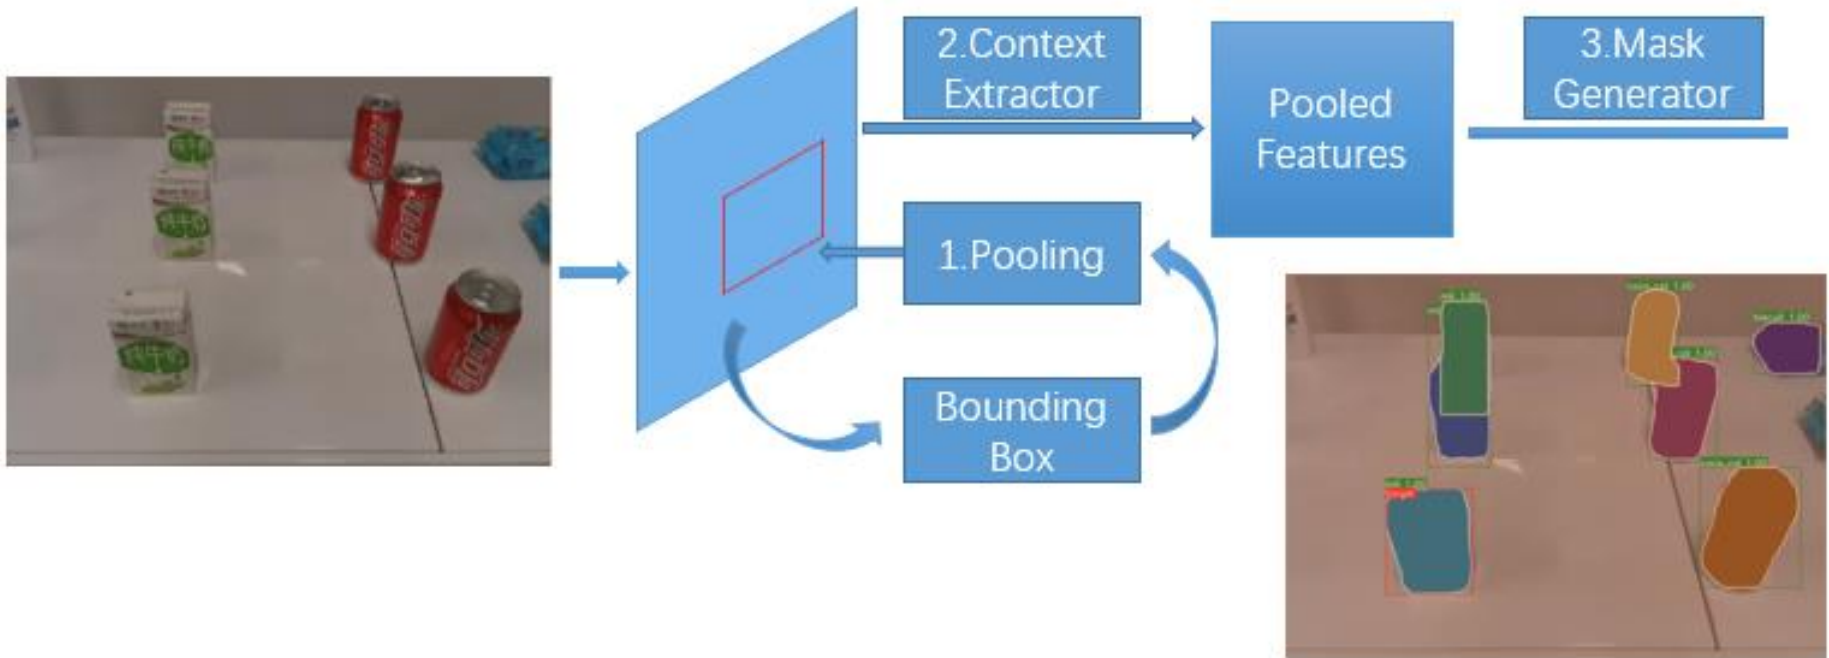

## Label Result

# Object Detection result

**Accuracy: 98%**

**Speed: 66 milliseconds**

```
categories_output:[7]  
mask_output length :1  
Time for MaskRCNN: 66.9338703156ms
```

# Pose Estimation

## Pose Estimation

- 1) RGB-D image based Object Point Cloud generation
- 2) Point cloud down sampling and noise removing
- 3) Point cloud clustering
- 4) PCA pose estimation
- 5) Bounding Box Visualization

# Pose Estimation

## Bounding Box Visualization and estimated pose

pose estimation result of **book**

pose estimation result of **shampoo**

### The Output:

Center of the point cloud (x, y, z )  
the long axis of the bounding box

Relative to the Robot end

# Result of object detection

# Result of pose estimation

13.8 FPS
